

The protecteddef package

Heiko Oberdiek*

<heiko.oberdiek at gmail.com>

2016/05/16 v1.1

Abstract

This packages provides `\ProtectedDef` for defining robust macros for both plain `TEX` and `LATEX`. First `ε-TEX`'s `\protected` is tried, then `LATEX`'s `\DeclareRobustCommand` is used. Otherwise the macro is not made robust.

1 Documentation

Many of my packages work for both formats plain $\text{T}_{\text{E}}\text{X}$ and $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$, even $\text{i}\text{n}\text{i}\text{T}_{\text{E}}\text{X}$ is often supported. It would be nice if fragile macros could be protected and made robust. However the different format worlds offer different solutions.

1.1 The $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$'s way

Usually `\newcommand` is used to define macros. It provides a check if the command to be defined is already defined or cannot be defined for other reasons.

For making robust macros $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ provides `\DeclareRobustCommand`. It shares the syntax with `\newcommand`. However it does not provide latters check. Internally the check is available via `\@ifdefinable`.

Internally the robust macro is using `\protect` with a nested macro definition. The `\protect` infrastructure is a feature of $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ and usually not available in other formats.

1.2 The $\epsilon\text{-T}_{\text{E}}\text{X}$'s way

The need for robust macros is addressed in $\text{eT}_{\text{E}}\text{X}$. It provides `\protected` that modifies the behaviour of `\def` in a similar way as `\long`. A protected macro does not expand in some expandable contexts like writing to a file or `\edef`.

1.3 The way of this package

The package tries to find the available protection mechanism. First it looks for $\text{eT}_{\text{E}}\text{X}$'s `\protected`, then it uses $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$'s `\DeclareRobustCommand`. If both fails, then the macro remains unprotected.

Additionally, $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$'s check, if a macro is already defined is added in all cases. First $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$'s `\@ifdefinable` is tried to be compatible with $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$. If `\@ifdefinable` is not available, then the test is implemented by asserting that the macro is undefined or has the meaning of `\relax`. If the test fails, then in all cases the macro is not defined and an error is thrown.

1.4 Usage

<code>\ProtectedDef * {<cmd>} [<num>] {<definition text>}</code>
--

Macro `\ProtectedDef` follows the syntax of $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$'s `\newcommand` with the exception that an optional argument is not supported. Macro `<cmd>` is to be defined as `\long` macro without star with `<num>` arguments.

The number of arguments `<num>` must be given as explicit digit 0 upto 9. Otherwise the part between the argument `<cmd>` and the `<definition text>` is taken as parameter text in the syntax of vanilla $\text{T}_{\text{E}}\text{X}$. Examples (with `\protected`):

```
\ProtectedDef*\foo}[1]{\message{#1}}
⇒ \protected\def\foo#1{\message{#1}}

\ProtectedDef\foo{abc}
⇒ \protected\def\foo{abc}

\ProtectedDef*\foo(#1)<#2>{#1/#2}
⇒ \protected\def\foo(#1)<#2>{#1/#2}
```

2 Implementation

```
1 (*package)
```

2.1 Reload check and package identification

Reload check, especially if the package is not used with L^AT_EX.

```

4 Installation

4.1 Download

Package. This package is available on CTAN¹:

[CTAN:macros/latex/contrib/oberdiek/protecteddef.dtx](http://ctan.org/macros/latex/contrib/oberdiek/protecteddef.dtx) The source file.

[CTAN:macros/latex/contrib/oberdiek/protecteddef.pdf](http://ctan.org/macros/latex/contrib/oberdiek/protecteddef.pdf) Documentation.

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](http://ctan.org/install/macros/latex/contrib/oberdiek.tds.zip)

¹<http://ctan.org/pkg/protecteddef>

TDS refers to the standard “A Directory Structure for $\text{T}_{\text{E}}\text{X}$ Files” ([CTAN:tds/tds.pdf](#)). Directories with `texmf` in their name are usually organized this way.

4.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory `TDS:scripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

4.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain $\text{T}_{\text{E}}\text{X}$:

```
tex protecteddef.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```
protecteddef.sty      → tex/generic/oberdiek/protecteddef.sty
protecteddef.pdf      → doc/latex/oberdiek/protecteddef.pdf
test/protecteddef-test1.tex → doc/latex/oberdiek/test/protecteddef-test1.tex
test/protecteddef-test2.tex → doc/latex/oberdiek/test/protecteddef-test2.tex
protecteddef.dtx      → source/latex/oberdiek/protecteddef.dtx
```

If you have a `docstrip.cfg` that configures and enables `docstrip`'s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

4.4 Refresh file name databases

If your $\text{T}_{\text{E}}\text{X}$ distribution (`te $\text{T}_{\text{E}}\text{X}$` , `mik $\text{T}_{\text{E}}\text{X}$` , ...) relies on file name databases, you must refresh these. For example, `te $\text{T}_{\text{E}}\text{X}$` users run `texhash` or `mktextlsr`.

4.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is `pdftk`, e.g. unpack the file into the current directory:

```
pdftk protecteddef.pdf unpack_files output .
```

Unpacking with $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$. The `.dtx` chooses its action depending on the format:

plain $\text{T}_{\text{E}}\text{X}$: Run `docstrip` and extract the files.

$\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$: Generate the documentation.

If you insist on using \LaTeX for docstrip (really, docstrip does not need \LaTeX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{protecteddef.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdf \LaTeX :

```
pdflatex protecteddef.dtx
makeindex -s gind.ist protecteddef.idx
pdflatex protecteddef.dtx
makeindex -s gind.ist protecteddef.idx
pdflatex protecteddef.dtx
```

5 Catalogue

The following XML file can be used as source for the [T_EX Catalogue](#). The elements `caption` and `description` are imported from the original XML file from the Catalogue. The name of the XML file in the Catalogue is `protecteddef.xml`.

```
483 (*catalogue)
484 <?xml version='1.0' encoding='us-ascii'?>
