

The `eolgrab` package

Heiko Oberdiek*

<heiko.oberdiek at gmail.com>

2016/05/16 v1.1

Abstract

This package implements a generic argument grabber to catch an argument that is delimited by the line end.

1 Documentation

The starting point for this package was a feature request of Arno Trautmann in the mailing list `texhax`¹ [1]. A macro `\eolsection` should behave like `\section`, but the argument should be delimited by the line end instead of given in curly braces:

```
\eolsection My Title
```

Phil Taylor answered this with an implementation for `\eolsection`. Because this feature could be useful for other macros as well, I answered with an implementation of `\eolgrab` as general solution [3].

Both formats plain `TEX` and `LATEX` are supported by the package, see the example for `\eolsection` below.

```
\eolgrab {<code>} <argument> <EOL>
```

Macro `\eolgrab` takes two arguments. The first argument is `<code>`, a classical undelimited `TEX` macro argument. The second argument is delimited by the line end `<EOL>`. The macro calls `<code>` with `<argument>` as argument in curly braces. Because the catcode of the line end is changed, `\eolgrab` will not work in the argument of other macros. Macro `\eolgrab` is made robust if either `ε-TEX`'s `\protected` or `LATEX`'s `\DeclareRobustCommand` is available.

```
\eolgrabopt {<code>} <argument> <EOL>
```

Macro `\eolgrabopt` passes `<argument>` as optional argument to `<code>` if `<argument>` is not empty.

```
\eolgrabopt\item foo
```

becomes to

```
\item[{foo}]
```

The curly argument braces are added to support square brackets inside `<argument>`. If the `<argument>` is empty:

```
\eolgrabopt\item
```

then

```
\item
```

is called without optional argument.

1.1 Examples

- The line

```
\eolgrab\section My Title
```

is equivalent to

```
\section{My Title}
```

¹Info page for mailing list `texhax`: <http://tug.org/mailman/listinfo/texhax>

- The next example uses the star form of `\section`. Then the command to be called consists of two tokens. Therefore the first argument of `\eolgrab` needs curly braces:

```
\eolgrab{\section*}My Title
```

becomes

```
\section*{My Title}
```

- Now L^AT_EX's `\PackageError` is used. This macro has three arguments, the package or class name, the message text and the help text. A standard help text of L^AT_EX is used as given in macro `\@ehc`. The second argument, the message text is used as argument, delimited by line end:

```
\eolgrab{\PackageError{foobar}}%
Some error message text\MessageBreak%
with several lines
\@ehc
```

In the first two lines of the example, the line end is suppressed by the comment character (percent), thus the argument is delimited by the line end of the third line. The result is:

```
\PackageError{foobar}{Some error message text\MessageBreak
with several lines}\@ehc
```

- The original request for macro `\eolsection`, see above, can be implemented easily with the help of `\eolgrab`. Example for L^AT_EX:

```
\usepackage{eolgrab}
\newcommand*{\eolsection}{\eolgrab\section}
```

Example for plain T_EX:

```
\input eolgrab.sty\relax
\def\eolsection{\eolgrab\section}
```

And a sophisticated variant for L^AT_EX that also supports the star syntax and the optional argument:

```
1  (*example-sec)
2  \documentclass{article}
3  \usepackage{eolgrab}
4  \makeatletter
5  \newcommand*{\eolsection}{%
6    \@ifstar{%
7      \eolgrab{\section*}%
8    }{%
9      \@ifnextchar[{%
10     \eoloptsection
11     }{%
12     \eolgrab\section
13     }%
14   }%
15 }
16 \newcommand*{\eoloptsection}[1] [] {%
17   \eolgrab{\section[#1]}%
18 }
19 \makeatother
```

```

20     \begin{document}
21     \tableofcontents
22     \eolsection Section without star and optional argument
23     \eolsection*Section with star
24     \eolsection[Short section title]Long section title
25     \end{document}
26     \end{example-sec}

```

1.1.1 Small L^AT_EX document as example

```

27 \begin{example-ltx}
28 \RequirePackage{eolgrab}
29 \eolgrab\documentclass article
30 \eolgrab\begin document
31 \eolgrab\section Hello World
32 \eolgrab\emph Some text
33 \eolgrab\end document
34 \end{example-ltx}

```

1.1.2 L^AT_EX document with environments

```

35 \begin{example-env}
36 \documentclass{article}
37 \usepackage{eolgrab}
38 \newcommand*\Begin{\eolgrab \begin}
39 \newcommand*\End  {\eolgrab \end  }
40 \newcommand*\Item {\eolgrabopt\item }
41 \Begin document
42 \Begin itemize
43   \Item
44     first item
45   \Item
46     second item
47 \End itemize
48 \Begin description
49   \Item foo
50     is the first syllable of foobar.
51   \Item bar
52     is the second syllable of foobar.
53 \End description
54 \End document
55 \end{example-env}

```

1.2 Limitations

Macro `\eolgrab` needs to catch the line end. If T_EX reads a line, then it throws away the line end characters (carriage return, line feed) and removes spaces at the end of the line. Then it adds the character with the character code that is given by `\endlinechar` at the end of the line. The category code of the inserted character is given by the current value of its `\catcode`. If `\endlinechar` is not a valid character code (especially if it is negative), then no character is added.

In plain T_EX and L^AT_EX the standard settings of the inserted endline character is the character with code 13 (or \sim in T_EX notation) with catcode 5 (end of line). That means the inserted end of line character behaves like a space token. For example, it is removed after macro names. Therefore `\eolgrab` changes the catcode.

Therefore `\eolgrab` has some limitations:

- Like other verbatim stuff, the macro `\eolgrab` cannot be used in the argument of other macros. `\eolgrab` want to change the catcode of the end

of line character. If this character is read before, because it is processed as argument of another macro, the catcode is already set and is not reassigned later if `\eolgrab` changes the category code for this character code.

- The argument must not contain the end of line character. Otherwise the first end of line character is already taken as delimiter, leaving the rest of the line outside the argument.
- Because `\eolgrab` is probably mostly used in the line with the delimited argument. Therefore changes of `\endlinechar` will not affect the current line.

2 Implementation

```
56 (*package)
```

2.1 Reload check and package identification

Reload check, especially if the package is not used with L^AT_EX.

```

4 Installation

4.1 Download

Package. This package is available on CTAN²:

[CTAN:macros/latex/contrib/oberdiek/eolgrab.dtx](#) The source file.

[CTAN:macros/latex/contrib/oberdiek/eolgrab.pdf](#) Documentation.

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](#)

TDS refers to the standard “A Directory Structure for T_EX Files” ([CTAN:tds/tds.pdf](#)). Directories with `texmf` in their name are usually organized this way.

4.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory `TDS:scripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

4.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain T_EX:

```
tex eolgrab.dtx
```

²<http://ctan.org/pkg/eolgrab>

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```
eolgrab.sty           → tex/generic/oberdiek/eolgrab.sty
eolgrab.pdf           → doc/latex/oberdiek/eolgrab.pdf
example/eolgrab-example-ltx.tex → doc/latex/oberdiek/example/eolgrab-example-ltx.tex
example/eolgrab-example-env.tex → doc/latex/oberdiek/example/eolgrab-example-env.tex
example/eolgrab-example-sec.tex → doc/latex/oberdiek/example/eolgrab-example-sec.tex
test/eolgrab-test1.tex → doc/latex/oberdiek/test/eolgrab-test1.tex
test/eolgrab-test2.tex → doc/latex/oberdiek/test/eolgrab-test2.tex
eolgrab.dtx           → source/latex/oberdiek/eolgrab.dtx
```

If you have a `docstrip.cfg` that configures and enables `docstrip`'s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

4.4 Refresh file name databases

If your \TeX distribution (`te \TeX` , `mik \TeX` , ...) relies on file name databases, you must refresh these. For example, `te \TeX` users run `texhash` or `mktextlsr`.

4.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is `pdftk`, e.g. unpack the file into the current directory:

```
pdftk eolgrab.pdf unpack_files output .
```

Unpacking with \LaTeX . The `.dtx` chooses its action depending on the format:

plain \TeX : Run `docstrip` and extract the files.

\LaTeX : Generate the documentation.

If you insist on using \LaTeX for `docstrip` (really, `docstrip` does not need \LaTeX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{eolgrab.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with `pdf \LaTeX` :

```
pdflatex eolgrab.dtx
makeindex -s gind.ist eolgrab.idx
pdflatex eolgrab.dtx
makeindex -s gind.ist eolgrab.idx
pdflatex eolgrab.dtx
```

5 Catalogue

The following XML file can be used as source for the [T_EX Catalogue](#). The elements `caption` and `description` are imported from the original XML file from the Catalogue. The name of the XML file in the Catalogue is `eolgrab.xml`.

```
366 (*catalogue)
367 <?xml version='1.0' encoding='us-ascii'?>
368 <!DOCTYPE entry SYSTEM 'catalogue.dtd'>
369 <entry datestamp='$Date$' modifier='$Author$' id='eolgrab'>
370   <name>eolgrab</name>
371   <caption>Catch arguments delimited by end of line.</caption>
372   <authorref id='auth:oberdiek' />
373   <copyright owner='Heiko Oberdiek' year='2011' />
374   <license type='lppl1.3' />
375   <version number='1.1' />
376   <description>
377     The package defines the command <tt>\eolgrab</tt> that reads an
378     string terminated by end of line, and then calls a macro with that
379     string as argument. Thus
380     <pre>\eolgrab\section My title</pre> is equivalent to
381     <pre>\section{My title}</pre>
382     <p/>
383     A second command <tt>\eolgrabopt</tt> provides the string as an
384     optional argument (which is useful for <tt>\item</tt>, for example).
385     <p/>
386     The package is part of the <xref refid='oberdiek'>oberdiek</xref> bundle.
387   </description>
388   <documentation details='Package documentation'
389     href='ctan:/macros/latex/contrib/oberdiek/eolgrab.pdf' />
390   <ctan file='true' path='/macros/latex/contrib/oberdiek/eolgrab.dtx' />
391   <miktex location='oberdiek' />
392   <texlive location='oberdiek' />
393   <install path='/macros/latex/contrib/oberdiek/oberdiek.tds.zip' />
394 </entry>
395 \catalogue)
```
